

Mid-semester Project Specifications

In addition to the base game requirements described in the prior document and reminded below, your mid-semester project needs to adhere to the specifications described below.

You are replicating and extend one of two classic games, Snake or Pang.

Base Game

For the *base game* you are required to implement a fully contained game, that includes at least **all** the items below.

- Title/end splash-screen, instruction screen and all the necessary screens
- Score mechanism and display.
- Smooth game-play.
- Sprites, animation that go with your narrative and overall appearance. You don't need to have everything as sprites. Having a transition between two states for one items can be sufficient.
- Debug, pause and dev keys that help the development, and demonstrate your algorithms such as collision, path and so on.
- A background music and sound effects that occur for events such as getting hit, item pickup

Extended game

The items of the base game needs to be well-integrated together to form a coherent, nice and fun game.

Specifically, having a strong game narrative tied to a coherent aesthetic throughout are key in making a personal contribution to a classic game.

Given the type of games, text should be minimal in splash-screens and instruction screens. Using simplicity, consistency, layout across visuals with succinct text/words can go a long way.

- [UI-design](#)
- [Interaction design](#)

Furthermore, you are required to add your own game mechanism(s)

- for snake you are required to add at least two game mechanisms,
- for pang you are required to add one.

The technicality of your personal game mechanism(s) need to be precisely explained in your readme, using your own words, and possible with your game or sketches to illustrating the algorithm steps.

Submission

- **Code**

The final submission of your project's code. Remember the structure, style and performance of your code are critical and will be an important factor of my assessment. -- Due **April 3rd, 5:00 p.m.**

- **readme.md**

This write-up presenting your game has to include at least the following sections.

- Game Description: Elevator pitch & detailed overview
- Key Features: Focusing on your unique elements, describing game mechanics, techniques/algorithm used
- Screenshots: demonstrate key features & game progression
- List of resources used: tutorials, tools, image provenance and people that you consulted with. In the code base those resources should be also referenced at the appropriate place they have been used. -- Due **April 6th, noon**

- **A Game Trailer**

- A short trailer for your game that you can use in your future portfolio, and could be posted on YouTube. Uploaded on your google drive and include the shared link in your readme. Should be less than 1 min. -- Due **April 6th, noon**
